Received 01-VI-2010. Corrected 28-VII-2010. Accepted 06-VIII-2010.

Abstract: Urban vegetation is of key importance because a large proportion of the human population lives in cities. Nevertheless, urban vegetation is understudied outside central Europe and particularly, little is known about the flora of tropical Asian, African and Latin American cities. We present an estimate of how the vegetation has changed in the city of San José, Costa Rica, after about one century, with the repeat photography technique (based on a collection of 19th and early 20th century photographs by José Fidel Tristán and others) and with data from the Costa Rican National Herbarium. We found little vegetation change in the landscape of San José during the 20th century, where a total of 95 families and 458 species were collected in the late 19th and early 20th century. The families with most species were Asteraceae, Fabaceae, Poaceae, Lamiaceae, Euphorbiaceae, Solanaceae, Cyperaceae, Acanthaceae, Malvaceae, Piperaceae and Verbenaceae. Similar results have been found in Europe, where the number of plant species often is stable for long periods even when the individual species vary. Rev. Biol. Trop. 58 (4): 1367-1386. Epub 2010 December 01.

Key words: Urban flora, effects of urbanization, city landscape, photographic comparison, species list.

Urban vegetation has mostly been studied in central Europe, where about 50% of species are alien, half of them introduced before the 15th century. Despite the heavy traffic among European cities, five centuries have not been enough to homogenize their flora: the communities of species introduced after the year 1500 are characteristic of each city (Frank *et al.* 2008).

For animals, which particular species occur in cities is predicted by the “environmental filtering model” that in turn is based on plants. The model states that (1) there is natural selection of species living in urban ecosystems, (2) plants define key habitat characteristics and (3) habitats define which animals can live in the city (Williams *et al.* 2009). Generally, moderate urbanization produces some increase in plant biodiversity but is deleterious for

invertebrates and mammals. A high level of urbanization is correlated with fewer species of plants, invertebrates, amphibians, reptiles, birds and mammals, possibly because humans willingly introduce plant species, but not animals, to their gardens (McKinney 2008).

Outside central Europe, urban vegetation is understudied but there are some recent data from Plymouth, England, where alien species increase with urbanization (Kent *et al.* 2001). Also in England, gardens in Sheffield have a total of 1 166 plant species (70% alien) and twice the garden size means 25% more species. In these gardens there are 63% biennials/perennials, 18% shrubs, 10% annuals and 8% trees (Smith *et al.* 2006).

In Anglosaxon and French North America, there is a surprising scarcity of recent studies on urban biotas, but some work has been done.

In the city of Halifax (Nova Scotia, Canada), soil moisture and light determine which species are present. Taxa adapted naturally to rock, grassland and flooded habitat find an analog habitat in the city and thrive (Lundholm & Marlin 2006).

The New York metropolitan region has 556 woody species and non-native invasive species are becoming more common (Clemants & Moore 2004). In the Pelham Bay Park, New York City, native species went from 72% to 60% and 26% of natives disappeared in 50 years (especially herbaceous and meadow-type plants, DeCandido 2004).

Even though recent studies are scarce, a meta-analysis found 79 studies of species richness with geographic data for New York City; of these, 17 studies found a decrease in species richness, six an increase and three found no change. However, all studies reported an increasing number of exotic species (Puth & Burns 2008).

Tropical cities are in areas of high biodiversity but little is known about Asian and especially African cities regarding urban flora. In Latin America the situation is better but worldwide no floral lists exist for the 50 most populated cities (Clemants 2002). In Jinan City, China, a methodological comparison found that gradient analysis from the urban center to the fringe gives better estimates of the urban flora than the traditional block-area analysis (Kong & Nakagoshi 2005). In Taipei, green areas have 164 tree species (few shared among sites) and large evergreen native species dominate. Larger parks have higher richness, more landscape fidelity to the original vegetation, and more rare and endemic species (Jim & Chen 2007). In Africa, the urban areas of the Nile Delta (Egypt) have vegetation that is mainly correlated with moisture, pH, fertility and texture gradients, but plants always occupy sites similar to their natural habitats (Shaltout & El-Sheikh 2002).

Latin America has a long history of scientific study of urban biota, particularly the plants and there are several recent studies from México, Peru, Brazil, Chile and Argentina.

In the city of Ensenada, Mexico, there are 161 species, 61% non-native (Garcillán *et al.* 2009). In Mexico City, trees are stressed from dry wind and unfavorable water flow caused by the pavement (Barradas 2000).

Brazil has the largest urban forest in world (Tijuca: 3 300 hectares) but it is being stressed by roads because roads are surrounded by invasive species that burn easily. The fires in turn open adjacent areas to more invasive vegetation and the damage spreads (Matos *et al.* 2002). There are very few studies of plants that grow on walls but in Jundiaí, Brazilian, walls have a biodiversity of 28 species (dos Reis *et al.* 2006).

Normally, satellites are not used to study urban vegetation but in Arequipa, Peru, satellite images show that desert vegetation is being lost because of urban expansion (Polk *et al.* 2005). However, only ground work can reliably identify species and this kind of work has shown that temperate South America is not different from North America and Europe: at least half of the plant species in the Argentinean cities of Mendoza and Rosario are introduced. In Luján de Cuyo, Mendoza, 61 species were identified: 69% introduced (Méndez 2005). The vacant lots of Rosario each have one dominant species, a few abundant species and many rare species. Therophytes predominate and the proportions of indigenous and introduced species are similar (Franceschi 1996).

Chile is the Latin American country with the largest number of recent studies. Synanthropic communities in an urban footpath of Valdivia represents six associations and two communities (Finot & Ramírez 1998). In Concepción, green areas are dominated by non-native ornamental species (Paucharda *et al.* 2006). The distribution of urban vegetation reflects social inequalities. In Santiago, poor areas can have ten times less plant cover than rich neighbourhoods (Hernández 2008), similar to other countries (Pedlowski *et al.* 2002). However, workshops in poor areas of cities can result in an improvement of their vegetation (Garzón *et al.* 2004).

In Costa Rica, there is a long history of study of urban plants that began with the National Museum's collection efforts in the late 19th century, but little has been published. Méndez & Fournier (1980) and Monge-Nájera *et al.* (2002a,b) studied the lichens and their relationship with air pollution. The use of European lichens proved successful when they were transplanted to this Tropical city (Grüninger & Monge-Nájera 1988). Francisco Fallas made checklists and abundance estimates of urban herbs in the late 1970's but to our knowledge he did not publish them. The program "Costa Rica: Jardín Botánico de América Tropical" produces manuals and labels for urban vegetation (www.hjimenez.org) and there is a program to provide urban parks with butterflies and their host plants (<http://www.lrsarts.com/plas/index.html>).

The biodiversity in patches of urban vegetation can be surprisingly high, at least in Costa Rica. For example, after 50 years, in only one hectare of urban vegetation in San José, there are 432 plant species (Di Stéfano *et al.* 1995, Nishida *et al.* 2009), a full new lichen family with a novel symbiotic lifestyle (*Eremithallus costaricensis*; Lücking *et al.* 2008), 200 butterfly species (Nishida *et al.* 2009) and a new species of Hymenoptera, *Meteorus oviedo* (Shaw & Nishida 2005).

We present an estimate of how the vegetation has changed in the city of San José, Costa Rica, after about one century, with a technique called repeat photography. We do not know of repeat photography studies on urban Costa Rican vegetation of San José, but the technique was used in Costa Rica by Horn (1989) to assess changes in the páramo habitat.

MATERIALS AND METHODS

We used a collection of photographs taken in the late 19th and early 20th centuries from the José Fidel Tristán Fernández Collection in the Archivo Nacional de Costa Rica and others reproduced by Leiva (2004). The sites were re-photographed on December 11, 2008 with a Nikon Coolpix 8800 camera (8 megapixels;

Fig. 1). The repeat photography technique, developed in 1880 (Webb *et al.* 2010) is good for detailed analysis (Hendrick & Copenheaver 2009) and is cost-effective (Robert *et al.* 2010). We used digital repeat photography, which is fast, detailed and reliable; can be stored for future corroboration and comparison; includes rich data that may become useful in the future; and can classify and measure information automatically (Crimmins & Crimmins 2008).

We re-photographed nine sites (exact year of original photograph included when known): **Site 1** Catedral Metropolitana Street: 0 Avenues: 2-4 (1896); **Site 2** Catedral Metropolitana St. 0 Av. 0-2 (c. 1910); **Site 3** Kiosco Parque Morazán St. 5-7 Av. 3 (1914); **Site 4** Colegio de Señoritas St. 3-5 Av. 4-6 (1914); **Site 5** Paseo Colón St. 36 Av. 0, looking east (1899); **Site 6** Paseo Colón St. 36 Av. 0 looking west; **Site 7** Antigua Casa Presidencial St. 15 Av. 7; **Site 8** Estación del Ferrocarril al Atlántico St. 21-23 Av. 3; **Site 9** Hospital de Niños St. 20 Av. 0.

We calculated % cover by clipping and weighing sections from photographs printed on standard bond paper; for example, if the clippings from buildings represented 20 % of the total weight of the photograph, we recorded that buildings represented 20% of the image. This technique is compared with others by Monge Nájera *et al.* (2002b).

We also present an analysis of plants collected in cantón de San José from 1885 through 1945 by the Museo Nacional staff (Base de Datos, Herbario Nacional, updated to April 13, 2009).

RESULTS

After about a century, the main change in San José city photographs is the much larger number of people. The reduction in vegetation affects grasses, shrubs and trees, but is small; the increase in buildings, streets, vehicles, sidewalks, lamps and signs is also small (Fig. 2).

A total of 95 families and 458 species were collected in the late 19th and early 20th century.

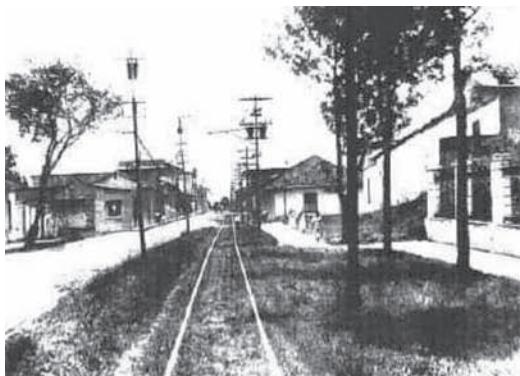

Fig. 1. Images used for the comparison: City of San José, Costa Rica.

NOTE: The original images used in the measurements appear in the Internet edition.

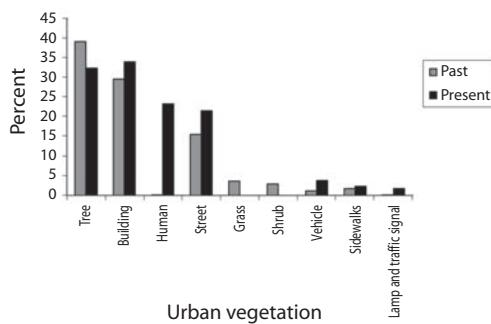

Fig. 2. Change in vegetation, infrastructure, vehicles and humans in photographs from the city of San José, Costa Rica, from a century ago to the present (% cover in photographs).

The families with most species were Asteraceae, Fabaceae, Poaceae, Lamiaceae, Euphorbiaceae, Solanaceae, Cyperaceae, Acanthaceae, Malvaceae, Piperaceae and Verbenaceae (Appendix 1).

DISCUSSION

Repeat photography was used in Costa Rica by Horn (1989) to assess changes in the paramo habitat (she found very little change) but we were unable to find a similar study of urban vegetation. Nevertheless, studies about plant biodiversity after long periods suggest

that our results are not unusual. For example, after 50 years, Brussels has the same total number of plant species that it had in 1940, albeit the individual species change and the same applies to other areas in much longer time spans (Chocholoušková & Pyšek 2003). We cannot make a comparison of species from *circa* 1900 to *circa* 2000 in San José because urban vegetation has rarely been collected in recent decades.

The increase in human presence in the city landscape is explained by the population growth of downtown San José or *Cantón Central* (from about 30 000 when the first photographs used in this study were taken *circa* 1900 to 356 000 when the sites were rephotographed in 2009; see: Centro Centroamericano de Población and Instituto Nacional de Estadística y Censos 2002). The small increase in the number of vehicles is an underestimation: the 2008 photographs were purposefully taken in low traffic periods to obtain a better view of the scenes.

Central European cities have a mean of 646 plant species/city and larger cities have more species (Pysek 1998), thus, considering that San José was and is a small city, the total of 458 species recorded is within the expected range.

Successful urban plants tend to belong to species adapted to natural habitats with strong sunlight, abundant nitrogen and low

water levels (Shaltout & El-Sheikh 2002, Chocholoušková & Pyšek 2003, Lundholm & Marlin 2006), so the presence of many Asteraceae, Fabaceae, Poaceae, Lamiaceae, Euphorbiaceae, Solanaceae, Cyperaceae, Acanthaceae, Malvaceae, Piperaceae and Verbenaceae is not surprising. Many of the plant species in Costa Rica are introduced (Chacón & Saborío 2005) and here again the situation is similar to that in other countries.

Urban trees mitigate global warming (Abdollahi *et al.* 2000, McPherson *et al.* 2008), significantly reduce urban heat islands (Huang *et al.* 2009) and can sequester about 100kg of air pollutants per hectare of urban forest (Vilela-Lozano 2004). Furthermore, urban vegetation protects many species in the five kingdoms (Dana *et al.* 2002, Smith *et al.* 2006), including valuable rare species (Maurer *et al.* 2000, Williams *et al.* 2009). For these and other reasons, the study and management of urban vegetation is of great importance.

Genetic diversity is low in urban plants and they are less prepared to cope with environmental change (Knapp *et al.* 2009), so periodic monitoring is needed to conserve original species as well as any others in need of protection (Godefroid 2001). Citizens can learn to effectively take advantage of urban vegetation (Garzón *et al.* 2004) and to recognize historical changes in the city scene (e.g. the repeat photography groups in www.flickr.com), not only for cultural reasons, but also to influence the administration of the urban flora by local governments.

Future studies of urban vegetation in San José could investigate these hypotheses:

- Floristic composition results from the interaction of human density, water availability, temperature, altitude and soil (Dana *et al.* 2002, Chocholoušková & Pyšek 2003, Fanelli & Tescarollo 2006, Altobelli *et al.* 2007).
- Ecological succession starts with ruderal annual plants, followed by perennials (Prach *et al.* 2001).
- Alien species benefit more from human activity (Niggemann 2009).

- With global warming, species adapted to colder climate will become less common and vice versa.

ACKNOWLEDGMENTS

We thank Hubert Blanco (Archivos Nacionales), Colegio Superior de Señoritas, María José Guerra Araus (Herbario Nacional), Sergio Aguilar, Sergio Quesada, Karla Vega, Andrea Sánchez and María Acuña for their assistance. We specially thank Sally P. Horn (University of Tennessee, Knoxville) for suggestions to improve the manuscript and for advice on repeat photography.

RESUMEN

La vegetación urbana es de vital importancia ya que una proporción importante de la población humana vive en ciudades. Sin embargo, esta vegetación es poco estudiada fuera del centro de Europa y se sabe particularmente poco sobre la flora urbana de las ciudades tropicales de Asia, África y América Latina. Aquí presentamos una estimación de cómo ha cambiado la vegetación en la ciudad de San José, Costa Rica, durante un siglo, con la técnica de la fotografía repetida (sobre la base de una colección de fotografías del siglo XIX y principios del siglo XX hechas por José Fidel Tristán y otros) y con los datos del Herbario Nacional de Costa Rica. Encontramos pocos cambios en el paisaje de San José durante el siglo XX. En la ciudad se recolectaron 95 familias y 458 especies entre finales del siglo XIX y principios del XX. Las familias con más especies fueron Asteraceae, Fabaceae, Poaceae, Lamiaceae, Euphorbiaceae, Solanaceae, Cyperaceae, Acanthaceae, Malvaceae, Piperaceae y Verbenaceae. Los resultados son similares a los de Europa, donde el número de especies de plantas a menudo es estable durante largos períodos, aunque las especies individuales varían.

Palabras clave: Flora urbana, efectos de la urbanización, paisaje de ciudad, comparación fotográfica, lista de especies.

<i>Myriophyllum aquaticum</i>	1941-10-18	Vitalia Sáenz 52
<i>Myrtus communis</i>	1928-04-29	Manuel Valerio
<i>Nasturtium mexicanum</i>	1891-08-31	H. Pittier 6906
<i>Nectandra martinicensis</i>	1896-06-22	A. Tonduz 10104
<i>Nectandra turbacensis</i>	1897-06-24	H. Pittier
<i>Nephrolepis occidentalis</i>	1908-10-06	Humberto Bertolini
<i>Nephrolepis undulata</i>	1922-08-07	Manuel Valerio
<i>Nicotiana tabacum</i>	1905-06-29	A. Tonduz
<i>Ochroma pyramidale</i>	1941-08-20	José Antonio Echeverría 27
<i>Oenothera biennis</i>	1905-06-29	A. Tonduz 17490
<i>Oenothera rosea</i>	1936-04-29	Juvenal Valerio 1119
<i>Oleandra costaricensis</i>	1908-09-04	Humberto Bertolini
<i>Ophioglossum reticulatum</i>	1888-07-31	Paul Biolley 925
<i>Oplismenus burmannii</i>	1890-12-07	A. Tonduz 3124
<i>Oplismenus burmannii</i>	1906-11-27	Otón Jiménez 9
<i>Ornithocephalus bicornis</i>	1904-12-30	Paul Biolley 17512
<i>Oxalis latifolia</i>	1896-07-31	A. Tonduz
<i>Pachira aquatica</i>	1933-04-15	Fernando Solís 526
<i>Pachyrhizus erosus</i>	1905-05-30	A. Tonduz
<i>Paspalum costaricense</i>	1890-10-31	A. Tonduz 3028
<i>Paspalum saccharoides</i>	1891-08-31	H. Pittier 6907

APPENDIX 1 (Continued)

Species collected in the late 19th and early 20th century

Species	Date	Collector
<i>Paspalum orbiculatum</i>	1889-06-30	H. Pittier 1183
<i>Paspalum distichum</i>	1888-07-20	H. Pittier 306
<i>Paspalum notatum</i>	1906-11-29	Otón Jiménez 29
<i>Paspalum conjugatum</i>	1892-09-30	A. Tonduz 758
<i>Passiflora adenopoda</i>	1929-08-30	José María Orozco 42
<i>Passiflora apetala</i>	1896-02-28	John Donnell Smith
<i>Passiflora edulis</i>	1905-04-29	A. Tonduz
<i>Paullinia barbadensis</i>	1893-01-31	A. Tonduz
<i>Pecluma plumula</i>	1888-07-31	Paul Biolley 920
<i>Pedilanthus tithymaloides</i>	1933-04-06	Manuel Quirós
<i>Pellaea ovata</i>	1908-10-06	Humberto Bertolini
<i>Peperomia tetraphylla</i>	1891-11-30	A. Tonduz 3198
<i>Peperomia lanceolatopeltata</i>	1892-10-05	A. Tonduz 7262
<i>Peperomia cooperi</i>	1888-07-31	Paul Biolley 524
<i>Peperomia lignescens</i>	1898-09-30	A. Tonduz
<i>Peperomia galloides</i>	1892-11-26	A. Tonduz
<i>Peperomia angularis</i>	1893-01-01	A. Tonduz
<i>Peperomia deppeana</i>	1890-07-31	A. Tonduz
<i>Phaseolus lunatus</i>	1893-01-02	A. Tonduz
<i>Phaseolus lunatus</i>	1888-01-15	H. Pittier 52
<i>Phaseolus lunatus</i>	1932-12-25	Fernando Solís
<i>Philadelphus myrtoides</i>	1889-12-31	A. Tonduz 1492
<i>Phlebodium pseudoaureum</i>	1888-07-31	Paul Biolley 900
<i>Phthirusa pyrifolia</i>	1892-08-31	A. Tonduz
<i>Phthirusa pyrifolia</i>	1904-10-30	A. Tonduz
<i>Phyla scaberrima</i>	1889-07-27	A. Tonduz
<i>Phyllanthus niruri</i>	1888-07-20	H. Pittier
<i>Piper bredemeyeri</i>	1889-06-20	H. Pittier 1088
<i>Piper hispidum</i>	1896-07-31	A. Tonduz 10154
<i>Piper aduncum</i>	1896-07-31	A. Tonduz
<i>Piper umbellatum</i>	1892-06-30	A. Tonduz 693
<i>Pittiera longipedunculata</i>	1890-07-12	A. Tonduz 3200
<i>Plantago australis</i>	1894-07-31	A. Tonduz
<i>Plantago major</i>	1894-07-31	A. Tonduz
<i>Plectranthus amboinicus</i>	1942-04-29	Manuel Quirós
<i>Pleopeltis macrocarpa</i>	1889-07-27	A. Tonduz 1229
<i>Pleopeltis astrolepis</i>	1892-07-31	A. Tonduz 7121
<i>Pleurothallis listerophora</i>	1890-07-31	Paul Biolley 2986
<i>Poa annua</i>	1888-05-31	H. Pittier 230
<i>Polyclathra cucumerina</i>	1890-07-12	A. Tonduz 3200
<i>Polygala platycarpa</i>	1888-05-31	Paul Biolley
<i>Polygala costaricensis</i>	1889-11-28	A. Tonduz 1450
<i>Polygala violacea</i>	1888-07-26	Paul Biolley 348

APPENDIX 1 (Continued)

Species collected in the late 19th and early 20th century

Species	Date	Collector
<i>Polygonum punctatum</i>	1892-07-31	A. Tonduz
<i>Polypodium triseriale</i>	1888-07-31	Paul Biolley 899
<i>Polypodium polypodioides</i>	1905-10-01	Otón Jiménez 291
<i>Polypodium triseriale</i>	1888-07-31	Paul Biolley 417
<i>Ponthieva racemosa</i>	1890-12-31	Paul Biolley 3240
<i>Portulaca oleracea</i>	1890-03-31	H. Pittier
<i>Prockia crucis</i>	1891-05-31	A. Tonduz
<i>Pseuderanthemum cuspidatum</i>	1888-07-31	Paul Biolley 942
<i>Psidium solisi</i>	1932-12-25	Fernando Solís 509
<i>Psidium cattleianum</i>	1909-09-21	A. Tonduz
<i>Psidium cattleianum</i>	1931-06-07	Manuel Quirós
<i>Psychotria pubescens</i>	1896-07-31	A. Tonduz
<i>Pterolepis pumila</i>	1888-12-12	H. Pittier 10
<i>Punica granatum</i>	1905-04-29	A. Tonduz 17469
<i>Pycreus rivularis</i>	1906-10-11	Otón Jiménez 75
<i>Rhynchelytrum repens</i>	1906-11-19	Otón Jiménez 58
<i>Rhynchosia longeracemosa</i>	1892-11-26	A. Tonduz
<i>Rhynchospora nervosa</i>	1906-11-29	Otón Jiménez 124
<i>Richardia scabra</i>	1896-07-31	A. Tonduz
<i>Ricinus communis</i>	1889-11-30	A. Tonduz
<i>Rivina humilis</i>	1890-10-31	A. Tonduz
<i>Robinsonella divergens</i>	1889-11-28	A. Tonduz
<i>Robinsonella lindeniana</i>	1931-01-12	Fernando Solís 110
<i>Rorippa mexicana</i>	1887-12-20	H. Pittier 29
<i>Rosa multiflora</i>	1892-06-30	A. Tonduz
<i>Rubus urticifolius</i>	1888-07-31	H. Pittier
<i>Rumex obtusifolius</i>	1896-07-31	A. Tonduz 10123
<i>Russelia sarmentosa</i>	1889-07-27	A. Tonduz
<i>Rytidostylis carthaginensis</i>	1888-07-31	Paul Biolley
<i>Sabazia urticifolia</i>	1896-07-31	A. Tonduz 10143
<i>Salvia wagneriana</i>	1889-11-30	A. Tonduz 1476
<i>Salvia occidentalis</i>	1893-01-31	A. Tonduz
<i>Salvia costaricensis</i>	1895-10-31	A. Tonduz
<i>Salvia lasiocephala</i>	1893-01-02	A. Tonduz
<i>Salvia polystachya</i>	1888-02-20	H. Pittier
<i>Salvia alvajaca</i>	1892-07-31	A. Tonduz 701
<i>Salvia occidentalis</i>	1931-01-03	Fernando Solís
<i>Salvia officinalis</i>	1938-03-30	Manuel Quirós
<i>Salvia polystachya</i>	1931-01-03	Fernando Solís
<i>Salvia tiliifolia</i>	1931-01-03	Fernando Solís
<i>Salvia wagneriana</i>	1940-10-19	María del Carmen Roviralta
<i>Sambucus mexicana</i>	1931-07-07	Fernando Solís 288
<i>Sambucus mexicana</i>	1931-07-07	Fernando Solís 288

APPENDIX 1 (Continued)

Species collected in the late 19th and early 20th century

Species	Date	Collector
<i>Sansevieria hyacinthoides</i>	1941-02-18	José Antonio Echeverría 4057
<i>Sapium macrocarpum</i>	1893-07-31	A. Tonduz 8209
<i>Scleria hirtella</i>	1888-11-30	H. Pittier 648
<i>Scoparia dulcis</i>	1889-07-31	A. Tonduz
<i>Scoparia dulcis</i>	1931-09-04	Fernando Solís
<i>Scutellaria purpurascens</i>	1891-06-30	A. Tonduz
<i>Sechium tacaco</i>	1902-10-31	K. Werklé 16674
<i>Selaginella serpens</i>	1888-07-31	Paul Biolley 927
<i>Selaginella cuspidata</i>	1888-07-31	Paul Biolley 929
<i>Senecio hoffmannii</i>	1888-01-15	H. Pittier 39
<i>Senna papillosa</i>	1896-07-31	A. Tonduz
<i>Serjania acuta</i>	1897-03-31	A. Tonduz
<i>Setaria geniculata</i>	1890-10-04	A. Tonduz 3008
<i>Sicyos sertuliferus</i>	1932-12-25	Fernando Solís 1100
<i>Sida haenkeana</i>	1891-05-31	H. Pittier
<i>Sigesbeckia jorullensis</i>	1931-01-03	Fernando Solís
<i>Simarouba glauca</i>	1944-06-28	José Antonio Echeverría 478
<i>Smallanthus maculatus</i>	1892-07-31	A. Tonduz 699
<i>Smilax spinosa</i>	1889-11-28	A. Tonduz 1466
<i>Solanum lanceolatum</i>	1892-09-30	A. Tonduz
<i>Solanum americanum</i>	1890-03-25	A. Tonduz
<i>Solanum americanum</i>	1931-01-03	Fernando Solís 33
<i>Solanum umbellatum</i>	1934-03-17	Estrella U. de Pacheco
<i>Solanum wendlandii</i>	1932-03-23	Collector data missing
<i>Sonchus oleraceus</i>	1890-11-30	A. Tonduz 3069
<i>Sorghum bicolor</i>	1888-07-31	H. Pittier 383
<i>Spananthe paniculata</i>	1896-09-30	A. Tonduz 10883
<i>Spananthe paniculata</i>	1931-01-03	Fernando Solís 64
<i>Spathodea campanulata</i>	1901-11-30	H. Pittier 16212
<i>Spermacoce assurgens</i>	1896-07-31	A. Tonduz
<i>Spigelia splendens</i>	1888-07-31	Paul Biolley
<i>Sporobolus indicus</i>	1890-05-15	A. Tonduz 2335
<i>Stachys costaricensis</i>	1887-12-20	H. Pittier 34
<i>Stachys costaricensis</i>	1896-07-31	A. Tonduz
<i>Stelis tricuspis</i>	1888-07-31	Paul Biolley 949
<i>Stellaria prostrata</i>	1890-10-31	A. Tonduz
<i>Stellaria ovata</i>	1931-01-03	Fernando Solís 34
<i>Stemodia verticillata</i>	1895-01-31	A. Tonduz 9621
<i>Struthanthus orbicularis</i>	1893-01-31	A. Tonduz
<i>Stylosanthes guyanensis</i>	1896-11-30	A. Tonduz
<i>Synadenium grantii</i>	1941-11-10	José Antonio Echeverría 103
<i>Syzygium jambos</i>	1889-10-31	A. Tonduz
<i>Tabebuia rosea</i>	1890-02-28	Paul Biolley 2215

APPENDIX 1 (Continued)

Species collected in the late 19th and early 20th century

Species	Date	Collector
<i>Tagetes microglossa</i>	1889-11-28	A. Tonduz 1451
<i>Talinum paniculatum</i>	1889-07-27	A. Tonduz
<i>Tecoma stans</i>	1889-12-12	A. Tonduz 1495
<i>Tetrapterys schiedeana</i>	1898-07-31	Paul Biolley
<i>Thalictrum lankesteri</i>	1888-07-31	Paul Biolley
<i>Thelypteris resinifera</i>	1886-01-31	Paul Biolley 1067
<i>Thunbergia alata</i>	1936-04-29	Juvenal Valerio 1136
<i>Thunbergia erecta</i>	1940-11-13	María del Carmen Roviralta 5
